

At 1:30pm on 11/23 I intentionally triggered a fresh drift of snow in a narrow avalanche path along the edge of the north bowl at Bridger. Northeast aspect at 7,600' elevation. The crown was 6-8" deep consisting of snow that fell today, 20' wide and ran 250' vertical. SS-ASc-R2-D1.5-I. Photo: GNFAC
