

Photos of some recent natural avalanches near Cooke City today attached. All of the slides observed appeared to just involve new snow from the Feb. 20-21 storm. (occurring on all aspects, but primarily on NE aspects)

New snow: generally about 50-80cms of settled new snow from Feb. 20-21.

Quite a bit of collapsing experienced today while breaking trail, particularly in the lower elevations.

Snowpit attached from a SE aspect at 8500'. HS: 170.

ECTP15- 55cms down, at new/old interface.
