

Natural avalanche on Fan Mountain

Date

Sat, 02/25/2023 - 13:30

From email 2/25/23: "... a good sized [slab](#) avalanche on Fan, NE Face. Crown height hard to estimate but looked like a 2' or so. Maybe running on interface from when it got cold earlier in the week? Possibly deeper than that but sure could have loaded that much this week. Anyway- very white [bed surface](#), good [propagation](#), 200' -300' crown length, debris stopped on upper bench. D2.5. Likely triggered by [cornice](#) fall."

Region

Northern Madison

Location (from list)

Fan Mountain

Observer Name

Mike Buotte
