Touchy storm slabs in Hyalite

Date Fri, 01/24/2025 - 12:00 Activity Ice Climbing

Very touchy storm slabs formed throughout the day. 6-8" deep by 3pm. low density snow/ $\underline{\text{slab}}$ but very fast moving. We were able to $\underline{\text{trigger}}$ steep (35+) rolls with chunks of ice and even got one to go with a falling rope. We saw one natural (d1) that ran ~200' down a gully near mummy 2.

Region Northern Gallatin Location (from list) Hyalite - main fork Observer Name R Griffiths
